

VisionIP: Traditional Image

A complete, image-enabled, hardware-independent item processing solution

Proven Performance for Advanced Image Item Processing

A complete image-enabled item processing solution, VisionIP: Traditional Image handles all of the paper-based processing requirements facing financial institutions, including proof of deposit, in-clearing, corrections, reject re-entry, reconciliation, balancing, edits, sorting, cash letters, statement processing, and more.

Industry-Leading Features

Bi-tonal/grayscale image capture – Depending on the sorter, the VisionIP: Traditional Image solution supports image capture in bi-tonal (black-and-white) or grayscale format. Grayscale format improves image quality, which, in turn, improves read rates when using the VisionIP: ImagePOD solution courtesy and legal amount recognition capability.

Image reject re-entry and balancing – During reject re-entry and balancing, the VisionIP: Traditional Image solution places images and the list of items to correct on the same screen. Operators can configure the layout that best suits their needs on the fly. As operators scroll the list, the on-screen image changes to match the selected item. The VisionIP: Traditional Image solution highlights the applicable field to be repaired, so operators can concentrate on that particular area of the item for key correction. VisionIP: Traditional Image software can be coupled with Metavante Image Solutions' optional DREAM module to virtually eliminate key rejects.

Image statement print – VisionIP: Traditional Image statement printing capabilities provide multiple options for producing customized account statements. Modification options include statement type, graphics, and data placement. Statements can be printed in portrait or landscape mode. And targeted marketing and promotional messages can even be included.

Turbo Edit – Turbo Edit provides a high-speed image display that improves key-correcting efficiency. Turbo Edit allows specific operators to correct specific item fields. It simultaneously displays up to six images associated with fields being corrected and provides cues, such as highlighting, that help operators locate correcting item data.

Web Key – Web Key allows your financial institution to improve operations by allowing off-site keying by remote personnel. Web Key not only includes the same capability as Turbo Edit for remote keying, but security, workflow, and reporting can also be centralized for better control over your remote key operations.

Suggestive balancing – During processing, Metavante's VisionIP: Traditional Image software automatically displays out-of-balance transactions. It also searches for the cause of the imbalance (transposition, misread, etc.) and suggests the appropriate correction. This improves operator speed when processing out-of-balance items.

Audio-assisted balancing – The VisionIP: Traditional Image Talking Transactions feature uses a computer voice capability to read items back to the operator during item correction. Audio-assisted balancing eliminates the need for a second operator to perform this function, reducing labor costs.

Instant reject re-entry and balancing – The VisionIP: Traditional Image solution allows operators to begin correcting rejected and out-of-balance items as soon as

VisionIP: Traditional Image

they reach the reject pocket. This increases your workflow efficiency, since all items can be corrected by the time the processing run is complete.

Multi-institution processing – Because it supports multiple sort patterns, the VisionIP: Traditional Image solution can handle intermixed in-clearings from the Fed, breaking them out and directing them to the appropriate sort pattern. Multi-institution processing allows items to be processed for many institutions profitably.

Multi-day processing – VisionIP: Traditional Image operators can change the processing date with a few mouse clicks, promoting efficiency. For example, operators can begin processing the next day's items before processing for the current day is complete (the date can be switched back to finish the current day).

Net settlement – Metavante's VisionIP: Traditional Image solution provides the functions necessary to manage all check clearing data entered prior to settlement. This allows an effective, centralized settlement process to be developed without additional hardware or software investment.

Sophisticated extracts – The VisionIP: Traditional Image solution has the power and capability necessary to prepare data files that are ready for posting when uploaded to the host processor. As many data files as necessary can quickly be prepared on-site.

Endpoint repass – With VisionIP: Traditional Image endpoint repass control features, smaller sorters with fewer pockets can split out transit items and generate cash letters as efficiently as larger sorters. This enables you to reduce your hardware investment, yet still obtain better float availability.

Superior fine sort algorithms – VisionIP: Traditional Image fine sort algorithms maximize sorter pocket usage

to reduce the number of sorter passes required for fine sorting.

Exception item pull – The VisionIP: Traditional Image solution easily handles exceptions from the previous day. All exception items from the host are translated into a table with codes that identify the exception type. During the exception run, VisionIP: Traditional Image pulls the exceptions and determines their exception type.

Research and data mining – VisionIP: Traditional Image software provides unequaled capability for retrieving previously processed data. Queries can be performed on any combination of MICR and data fields across multiple processing days and storage media (RAID, CD-ROM/DVD, etc.) to quickly reconcile processing errors, answer customer inquiries, and mine valuable marketing data.

Advanced editing – The advanced editing features of VisionIP: Traditional Image give operators the ability to open run files to edit items and to key and add items “on the fly” to run files. Advanced editing also gives system administrators precise control over the data tables built during item processing to configure tables to accept data from any MICR layout.

Multiple sorter interfaces – Hardware compatibility is not an issue with VisionIP: Traditional Image software. A variety of available sorter interfaces enables the VisionIP: Traditional Image solution to work “out of the box” with practically any sorter.

Reject Repair – Reduce the labor needed to process rejected items that cannot be read by the reader/sorter. Reject Repair allows you to re-encode pre-stripped rejects and turn them into high-speed items. Metavante Image Solutions' optional DREAM module can be added to virtually eliminate operator entry of MICR rejects.

VisionIP: Traditional Image

DREAM (Dynamic Reject Entry Automation Module)
 – Take automated processing beyond data entry to reject re-entry. DREAM uses advanced ICR to make its own attempt at correcting a rejected item before allowing the item to be passed to an operator. In most cases, DREAM can make the required item corrections, minimizing operator reject re-entry labor. You can perform item processing tasks earlier and get a head start on balancing to meet Federal Reserve deposit deadlines.

VisionIP: Traditional Image features complete parameterization to allow administrators to modify operations without custom coding. System administrators, operations managers, and processing personnel alike appreciate VisionIP: Traditional Image real-world system features:

- Relational database management for performance and ease of customization
- Complete parameterization with configurable database, data tables, and sort logic
- Comprehensive system security, including user logins and extensive system logs
- Multi-printer support that prevents statement printing from becoming a bottleneck
- Image-based NSF notice generation (VisionIP: Traditional Image 2, 3, 4)
- State-of-the-art reconciliation tools
- A flexible graphical user interface (GUI) that lets operators arrange the screen to their preference
- Icon- and button-driven operation. Features include cut-and-paste and range selection

Pre-Eminent Technical Support

VisionIP is supported by a world-class Technical Resource Group skilled in both system installation and support. The Technical Resource Group is ready 24/7, 365 days a year, to answer your questions and provide timely assistance.

VisionIP: Traditional Image Solution Features

- Totally Parameterized Functionality
- Suggestive Balancing
- Audio-Assisted Balancing (Talking Transactions)
- Instant Reject Re-Entry and Balancing
- Multi-Institution Processing
- Multi-Day Processing
- Stop Pay Processing
- Net Settlement
- Sophisticated Extracts
- Endpoint Repass
- Superior Fine Sort Algorithms
- Exception Item Pull
- Research and Data Mining
- Advanced Editing
- MICR Line Capture/Proof of Deposit
- Standard Reports
- Report Writer
- Multiple Sorter Interfaces
- Bi-Tonal/Grayscale Image Capture, Storage, Processing
- Image Reject Re-Entry

VisionIP: Traditional Image

- Image-Assisted Balancing
- Image Statement Print
- Turbo Edit
- Operator Productivity Reporting
- CAR/LAR
- CAR Location and Recognition
- Bi-tonal/Grayscale Image Support
- CAR Scalability
